Traditions in
manufacturing of electric
motors and axial fans
since **1961**.

<https://retail5.com.ua>

About Us

MMOTORS is a Bulgarian company engaged with manufacturing activities in four divisions:

1. Division for the production of asynchronous electric motors.
2. Division for the production of fans.
3. Division for the production of infrared heating panels.
4. Division for the production of high-quality aluminum components.

The company was founded in 1961 under the name "Micromotors". As a result of continuous technological renewal, introduction of new production methods, development activities and the use of financing granted under European programs, MMotors is currently one of the leading manufacturers of electric motors and fans on the Balkan Peninsula. MM products are sold successfully in the Balkan countries, EU, Russia, Middle East and Africa.

Company philosophy

The company philosophy of MMotors JSC is based on the extensive experience of its shareholders and engineers always working to deliver quality and affordable solutions. Putting our clients first, we are faithful to our duties in creating innovative and reliable products. We are driven by the passion in achieving unique results.

Our strategy is introduction of the best manufacturing practices, continuous investment in technological innovation and functionality.

We are a longstanding partner for our customers. Our representatives are committed to understand and assess each and every individual need. We devote ourselves to the progress and quality of life.

Vision for the future

We continue to create new products. In every new product we take care of the future by:

1. Saving the planet's energy resources through introduction and manufacturing of high-energy efficient products.
2. Contributing to a cleaner environment through the recycling of old products, the use of harmless materials and the observance of environmental regulations.
3. Improving the lifestyles of our customers. We develop and offer products for a healthy lifestyle.

Foundry activity

Division for the production of high-quality aluminum components.

Fans

Division for the production of fans. Here are being manufactured compact ventilation systems Eco-Fresh, bathroom fans, duct and centrifugal fans, wall mounted axial fans, fans for equipment and electronics cooling, window fans, high-temperature resistant fans assembled in heating installations, ventilation grids.

Plastic components

Division for the production and recycling of high-quality plastic components.

Electric motors

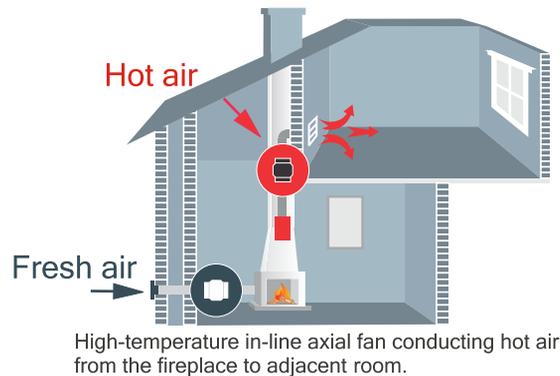

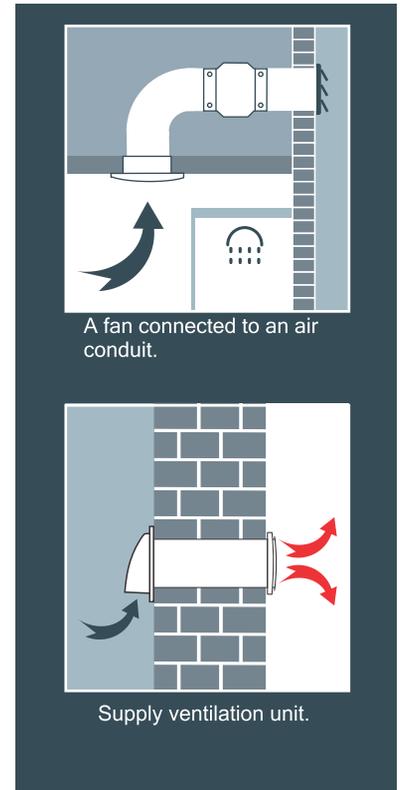

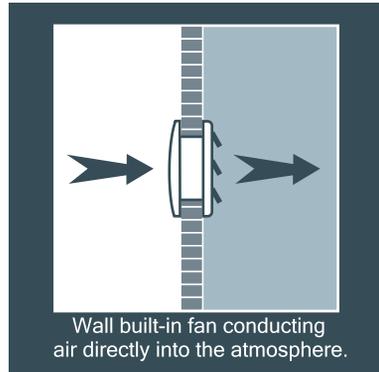

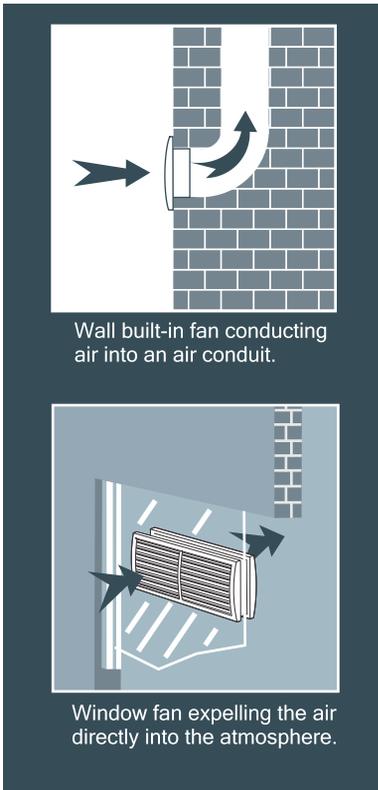

Division for the production of asynchronous electric motors with capacities from 0.04KW up to 11KW, including high efficient IE2 and IE3 electric motors and special series of electric motors for hoists. Height of axis rotation - 63, 71, 80, 90, 100, 112 and 132mm.

About Ventilation

Good indoor air quality is the key factor for a healthy lifestyle, since so much of our time is spent inside buildings.

Eliminating unpleasant smells, smoke, and steam is crucial for our comfort and reduces the risk of respiratory diseases and allergies.

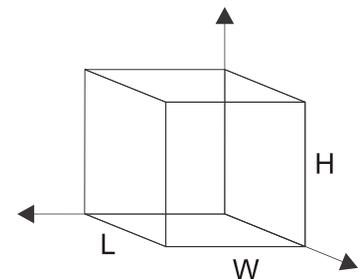

Controlling the condensation prevents the formation of fungi and mould, as well as reduces the aging process of the premises.

Choosing the right fan:

Efficient ventilation depends on the type of fan or several fans with the appropriate capacity. The following factors should be taken into consideration:

- volume of the premise $V=LxWxH(m^3)$
- air exchange per hour (P), table #1 and #2

Air exchange per hour

Table 1

Living premises	Air exchange per hour P
Kitchen	6
Bathroom	5
Sanitary premises	7
Laundry	10
Basement	4
Garage	4

Table 2

Working premises	Air exchange per hour P
Office	5
Bank	2
Bars, cafes	9
Canteens	5
Restaurants	6
Public bathrooms	10
Hotel rooms	2

c) volume coefficient of the room furniture "K" (K=0.7-0.95 depending on the volume and quantity of furniture in the room).

How to calculate the fan capacity:

For a bathroom measuring 2,2 m length, 1,8 m width, and 2,44 m high, the volume V of the room is

$$V=L \times W \times H= 9,66 \text{ m}^3.$$

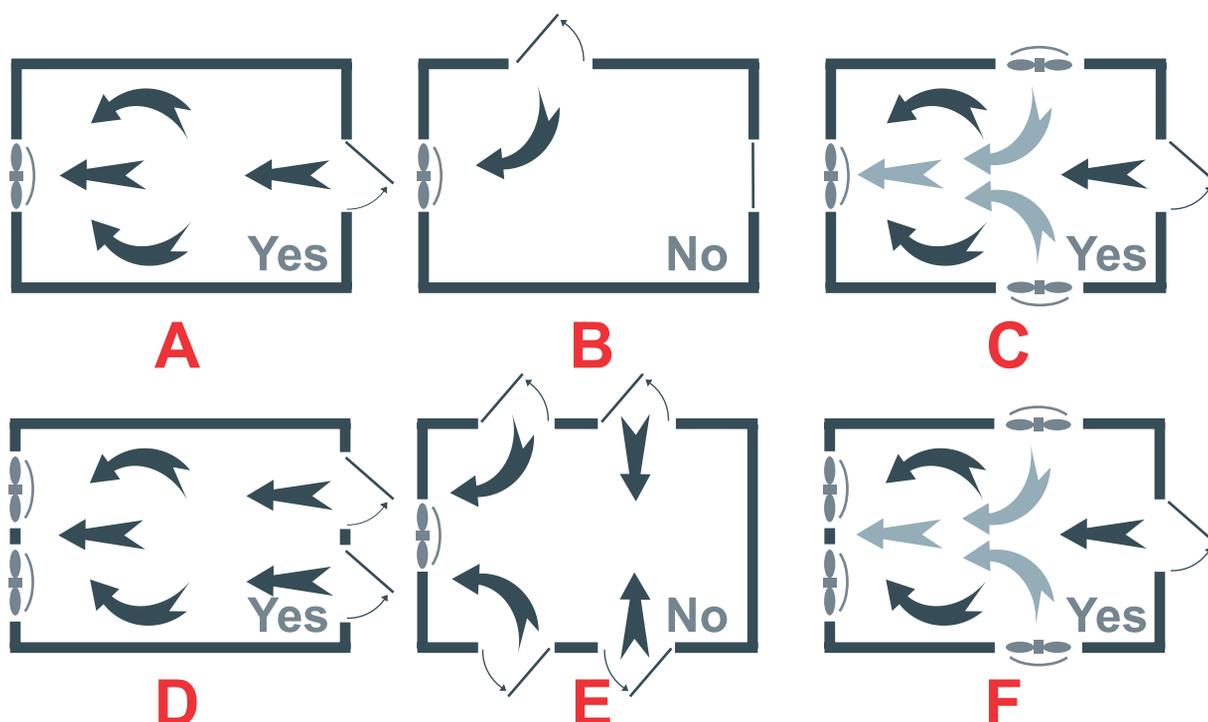

The fan capacity D is calculated by the formula:

$$D=V \times P \times K =9,66 \times 5 \times 0.9 = 43,47 \text{ m}^3/\text{h}$$

where:

- "P" is the recommended air changes per hour on Table 1 and 2;
- "K" is the volume coefficient of a bathroom.

Efficient ventilation depends on choosing the right place for the extractor fan and the location of the air inlets.

When the doors and windows are closed, fresh air flows in through apertures, vent openings or inlet fans. The air inlets and outlet must be installed in specific places so that fresh air evenly spreads all around the premises (Diagrams A, D, C and F as above). It is advisable that instead of one big ventilation device, several smaller ones are installed, equivalent to the capacity of the bigger ventilation device as shown on diagrams.

This will create an active (as opposed to passive) intake system. Typically, when your extractor fan sucks air out of your room, air is passively going to be drawn back into the room (Diagrams A, B, D and E). By installing a second fan on the intake side (Diagram C and F), you will reduce the amount of negative suction created, thereby allowing much more air to pass through.

What we need to know about our safety when selecting and installing a fan?

Bathroom Zone Regulations

SAFETY

For your safety, we recommend using a low voltage (12V) LV series fans in ZONE 1.
The 230V fans are safe to install in ZONE 2 and 3.

Basic model

The base model is available with or without an auto-closing back shutter.

Timer

The fan will operate when the light switch is switched on or from a separate switch.

The built-in timer will ensure operation for 5 or 15 minutes after the light is switched off.

Humidistat & Timer

The fan will operate when it is switched on or when the humidity in the premises reaches over 70%. The timer ensures operation for 5 or 15 minutes after the humidity is reduced below 70%.

Light Relay & Timer

The fan will operate when the room is lit while the built-in timer ensures operation for 5 or 15 minutes after the light is off.

LED lights

Model with LED luminous strip. Available in 5 colors, respectively:

Ultra economical

Energy-efficient low-noise fans.

Two speed fan

Energy-efficient low-noise fans.

Back Shutter

Automatic closing shutter preventing the entry of unpleasant odors and insects available as an optional accessory.

CREATING CLEAN AND HEALTHY ENVIRONMENT

In an era of globalization,

permanent deterioration of ecology and rapid expansion of cities, humanity is under a constant attack.

According to the World Health Organization, the most harmful to the human organism, among all other environmental influences, is the polluted air. The report released in 2013 announces that polluted air is the most significant threat to human health and, contrary to popular belief, the air in the premises is more dangerous than the one outside.

The rooms contain many bacteria, viruses, mold spores and other microorganisms harmful to humans. Some of these microorganisms develop due to poor air conditioning, high temperature, sometimes due to excessively dry air. In most cases, our homes have no barriers against dangerous organic particles contained in contaminated outdoor air and which are penetrating unfiltered into our homes. Modern man does not even know how many of his health problems are caused by air in his own home or workplace and that is where we spend 90% of our life. Ventilation is a first-rate addition for air conditioners that regulate the temperature but do not change the stale air in the room.

"Eco-Fresh" is a big step in the ventilation systems development. The use of Eco-Fresh in living rooms sets a new level in fresh air supply.

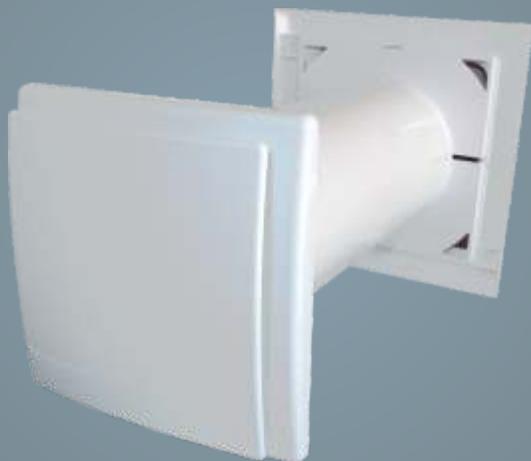

As a base the system "Eco-Fresh" has a silent fan with double-encapsulated ball bearings, multi-stage filtration system, thermostat, heat exchanger, ionizer and humidity sensor.

The heat exchanger keeps the same air temperature and the built-in ionizer fills the air with negative ions, which has antiseptic effect, kills disease-causing microorganisms - viruses and bacteria, preventing infections and acute respiratory diseases.

Ionized air improves working capacity, eliminates the fatigue, and positively affects the human overall tone. "Eco-Fresh" has a wide range of settings which allows this device to be used for different purposes and under different conditions. The five speed mode provides silent operation of the system during sleep and an active ventilation during the day. The device can be installed at the construction stage as well as in already completed buildings. Following the trends of the modern interior, a wide selection of decorative panels is available. The system can be controlled by a remote control or a wall panel.

This system has undergone many years of testing in medical centers, schools and kindergartens and has proven its effect.

SENSOR CO

The sensor is constantly monitoring for carbon monoxide presence in the premise.

HYDROSTAT

Controls humidity within 75%.

IONIZER

Ionizes the air by which removes unpleasant odors, kills pathogenic microorganisms and prevents the growth of fungus and mold.

REVERSIBLE VENTILATION

With thermal energy recovery.

HEATEXCHANGER

Contributes to a significant reduction of heat loss during ventilation.

CERAMIC HEATER

Heater with positive temperature coefficient, self-regulating (50~400W) and economical.

HEATER

Economical, designed for pulse operation. Maintain the temperature of the incoming air 23°C.

2 SPEED

2 speed blast fan, allows regulation of fan duty from 45m³/h in night silent mode, up to 70m³/h in day mode.

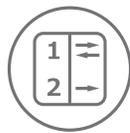

5 SPEED

5 speed blast fan, allows regulation of fan duty from 30m³/h in night silent mode, up to 120m³/h in day mode. Serves for blasting clean air from outside.

REMOTE CONTROL

You can control all the functions of the system remotely

CONTROL PANEL

Regulates smoothly the amount of incoming air from 30m³/h to 100m³/h.

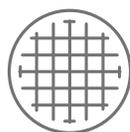

ACTIVE CHARCOAL FILTER

Guarantees the clean airflow even in strong polluted urban areas and industrial regions. Cleans the air from smells, dust, bacteria, soot, car exhaust gases and other.

HEPA FILTER

High efficiency particulate air.

SAFETY NET

Preventing the entry of insects.

SHUTTER

Prevents the inflow of cold air when the unit is switched off.

Extractor Fans

Bathroom fans are the most popular and affordable modern solution for the removal of moisture from wet rooms and the prevention of mold and fungus formation.

MM Series – Bathroom and WC fans featuring modern design, high airflow rate and uncompromising quality. These fans provide continuous or interrupted ventilation in the sanitary facilities at extremely low power consumption.

They can be used to purge air from small and medium-sized residential, office and commercial premises or as heat exchangers between adjacent premises.

The fans are mounted on walls, ceilings and suspended ceilings and are attached to air ducts or pipes of the building's ventilation system with connection diameters 90 mm, 100 mm, 120 mm and 150 mm.

Safety

The MM Series fans are made of high-quality and harmless materials, and they comply with noise and fire safety standards.

The protection degree of the built-in electric motor is IP 24, IP X4, IP X5 and IP 56 which enables the fan to normally operate in high humidity environment. All models from this series are fitted with an insect protection net. It is possible to equip the fans with back shutter, timer, humidity and light sensors, and built-in LED lighting.

The fans are connected to single-phase grid by a switch or dimmer to control the speed. Fans can be custom manufactured for other power supply voltages.

Low voltage LV 12V models, guaranteeing high safety level, could be mounted near the shower area (zone 1 of the scheme) or connected to shower cabins.

Energy-efficient

MM UE - Energy-efficient low-noise fans with IP X5 protection degree and a flow rate of up to 85m³/h and 100m³/h which consume only 5,5W/h.

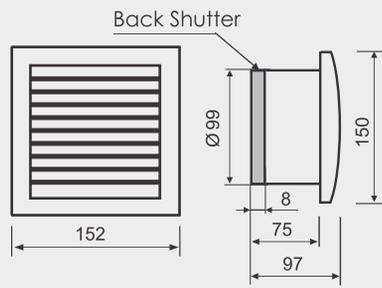

Series with double capsulated ball bearings NSK Japan which guarantee 30 000 hours of continuous operation.

VENTILATION SOLUTIONS

MMP Designer series

Elegant & Stylish

Designer series of bathroom and WC fans with spectacular front panel made of glass, plastic, metal or wood

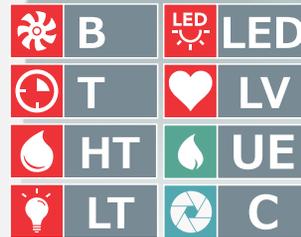

<https://retail5.com.ua>

MMP SERIES

Trickle Impregnation Technology

- Sealed motor against dust and moisture
- High temperature resistant electric motor
- Maximum isolation characteristics
- Longevity of the electric motor

Extractor Fans

MMP Series – Designer series of bathroom and WC fans with spectacular front panel made of glass, plastic, metal or wood. Elegant and beautiful fans with high airflow and impeccable quality that will make your bathroom stylish and bring freshness to your home.

These fans secure continuous or interrupted ventilation in the sanitary facilities. They can be used to purge air from small and medium-sized residential, office and commercial premises or as heat exchangers between adjacent premises.

The fans are mounted on walls, ceilings and suspended ceilings and are attached to air ducts or pipes of the building's ventilation system with a connection diameter of 90mm, 100 mm, as well as to 120 mm air ducts or pipes through a special adapter.

NEW Short Spigot Models

Specially designed fan series with 30 mm installation depth for limited mounting spaces.

Safety

The MMP Series fans are made of high-quality and harmless materials, and they comply with noise and fire safety standards.

The protection degree of the built-in electric motor is IP 24, and the degree of the high airflow motor is IP 56 which enables the fan to normally operate in high humidity environment. It is possible to equip the fans with back shutter, timer, humidity and light sensors, and built-in LED lighting.

The fans are connected to single-phase grid by a switch or dimmer to control the speed (excluding UE models). Fans can be custom manufactured for other power supply voltages.

Low voltage LV 12V models, guaranteeing high safety level, could be mounted near the shower area (zone 1 of the scheme) or connected to shower cabins.

Energy-efficient

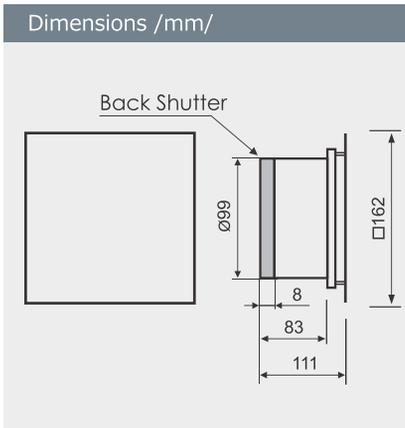

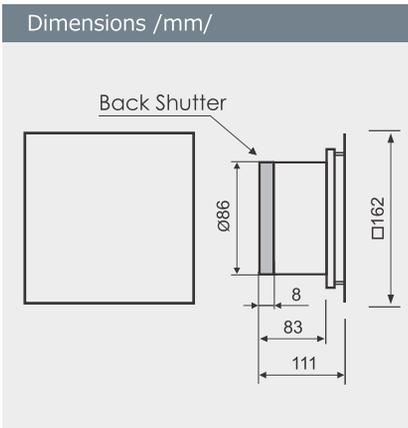

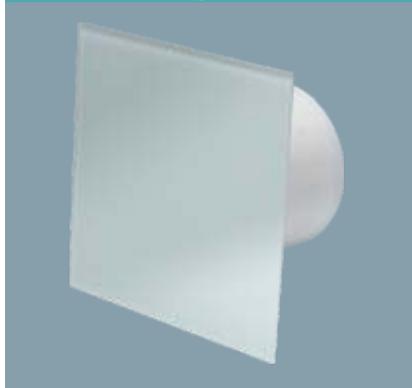

MMP UE - Energy-efficient low-noise fans with IP X5 protection degree and a flow rate of up to 85m³/h and 100m³/h which consume only 2,3 or 5,5W/h.

Series with double capsulated ball bearings NSK Japan which guarantee 30 000 hours of continuous operation.

OK, WE & MT SERIES

	B		LED
	T		LV
	HT		UE
	LT		C

Extractor Fans

Bathroom and WC fans at competitive prices – affordable to every customer, yet with excellent quality and beautiful design. These fans provide continuous or interrupted ventilation in the sanitary facilities at extremely low power consumption.

They can be used to purge air from small and medium-sized residential, office and commercial premises or as heat exchangers between adjacent premises.

The fans are mounted on walls, ceilings and suspended ceilings and are attached to air ducts or pipes of the building's ventilation system with a connection diameter of 90 mm, 100 mm, as well as to 120 mm air ducts or pipes through a special adapter.

Safety

The fans from the OK and WE Series are made of high-quality and harmless materials, and they comply with noise and fire safety standards. The protection degree of the built-in electric motor is IP 24 which enables the fan to normally operate in high humidity environment. It is possible to equip the fans with back shutter, timer, humidity and light sensors, and built-in LED lighting.

The fans are connected to single-phase grid by a switch or dimmer to control the speed. Fans can be custom manufactured for other power supply voltages.

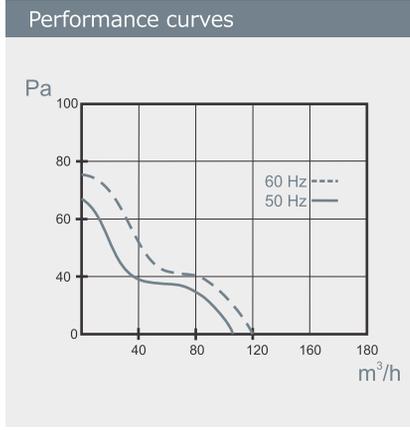

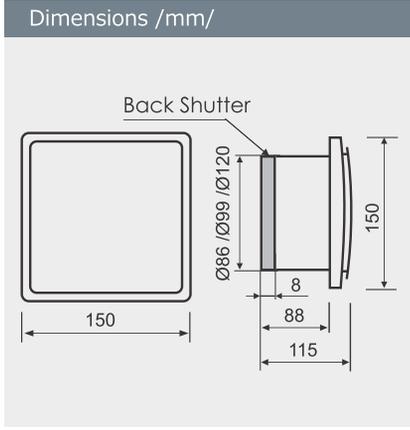

Low voltage LV 12V models, guaranteeing high safety level, could be assembled near the shower area (zone 1 of the scheme) or connected to shower cabins.

Low voltage LV 12V models, guaranteeing high safety level, could be assembled near the shower area (zone 1 of the scheme) or connected to shower cabins.

Energy-efficient

OK UE - Energy-efficient low-noise fans with IP 24 protection degree and a flow rate of up to 74m³/h and 100m³/h which consume only 2,3W/h.

Sauna & Steam Room Extractor Fans

<https://retail5.com.ua>

| We love your sauna

As a result of the abundant sweating and the thermal radiation process when using a sauna or steam room, toxins, fluids and bacteria, adversely affecting the human respiratory system, are released inside the premises. In this aspect, sauna ventilation is an important factor in improving comfort, rejuvenating the air, reducing the risk of damage to the lungs and the cardiovascular system.

Ventilation of the sauna and steam room further enhances the health effect by contributing to accelerate the body's own healing activity and ability to recover.

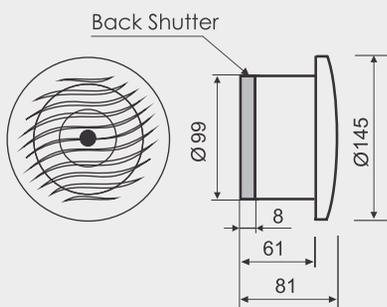

That's the reason why we have developed a specially designed high-temperature resistant fan for sauna and steam room that operates at temperatures up to 140°C and 100 % humidity. When the fan is turned off, a back shutter is provided to prevent the cold air from entering the premise.

The fan's electric motor, housing, blade and valve are made of materials which enable the device to operate at high temperature and humidity, and it could be mounted directly into the premise without the risk of getting overheated.

Products without a code are custom made. All products of the MM-S series can be manufactured on 12V (LV - Safety Zone 1).

VENTILATION SOLUTIONS

Axial Fans VA Series

FOR SPECIAL APPLICATION

Basic & High Temperature Resistant Models

<https://retail5.com.ua>

Trickle Impregnation Technology

- Sealed motor against dust and moisture
- High temperature resistant electric motor
- Maximum isolation characteristics
- Longlivity of the electric motor

LONG life
30 000h

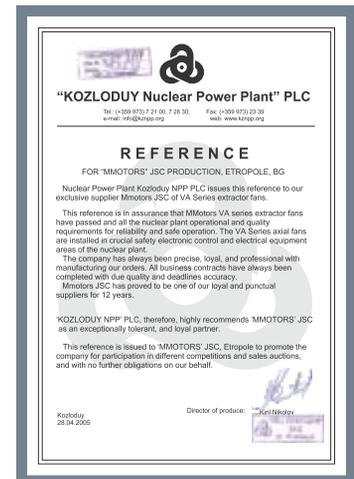

Series with double capsulated ball bearings NSK Japan which guarantee 30 000 hours of continuous operation.

Axial fans fall into the following categories: VA 9/2, VA 12/2, VA 12/2K, VA 14/2, VA 16/2.

Designed for:

- cooling of electronic control panels;
- ventilation of electrical panels;
- installation in devices in electronics, appliance construction and automation;
- cooling of welding machines and plasm cutting machines;
- installation in cooling and ventilation systems and air-conditioning devices;
- installation in household air heaters and heat exchangers.

All fans of this type have a built-in single-phase electric motors with shielded poles and a short-circuited rotor with double capsulated ball bearings. The fan is square in shape with internally located fins to which the stator is attached.

The VA series axial fans are suitable to be fitted to apertures and air conduits with Ø90, Ø100, Ø120, Ø135 and Ø150. They can be produced with supply voltages 230V, 115V, 36V or 24V, at frequency of 50Hz or 60Hz.

Isolation class: "H" - 180 degrees Celsius or "L" - 200 degrees Celsius.
Protection degree: IP 44.

Operating conditions:

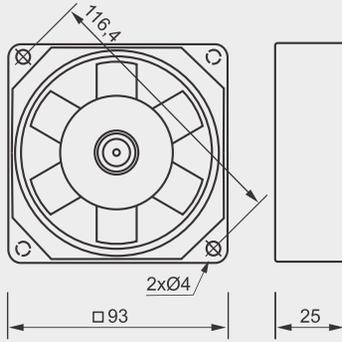

The fans are designed to operate under normal climatic conditions where the ambient temperature can vary from -5 degrees Celsius up to +60 degrees Celsius and a relative humidity from 40% to 98% at 30 degrees Celsius.

Upon clients' request the fans can be manufactured to operate at higher temperatures, in tropical or coastal climatic zones.

Trickle Impregnation Technology

- Sealed motor against dust and moisture
- High temperature resistant electric motor
- Maximum isolation characteristics
- Longlivity of the electric motor

LONG life
30 000h

Series with double capsulated ball bearings NSK Japan which guarantee 30 000 hours of continuous operation.

The fans from **VOK** and **VO** series are designed to be attached to Ø90, Ø100, Ø120, Ø135 and Ø150 air ducts in ventilation, air conditioning and heating installations.

The fans are available in two versions:

- Standard version (VOK, VO);
- High-temperature resistant version (VOK-T / VO-T) applicable to heating and ventilation systems with airflow's maximum temperature up to 150°C.

The fans are equipped with a built-in silent electric motor with double-encapsulated ball bearings which guarantee 30,000 hours of faultless operation when installed horizontally or vertically.

The body, the turbine, and the back shutter are manufactured from aluminum alloy or **Glass-filled Polyamide** which guarantees efficient cooling and better fire safety.

ACCESSORIES

• Mounting Bracket

VOK models with assembly openings measuring 100mm, 120mm and 150mm can be equipped with a mounting bracket.

• Back Shutter

VOK models with assembly openings measuring 100mm, 120mm and 150mm can be equipped with automatic closing shutter (accessory) preventing the entry of cold air and insects when the fan is switched off.

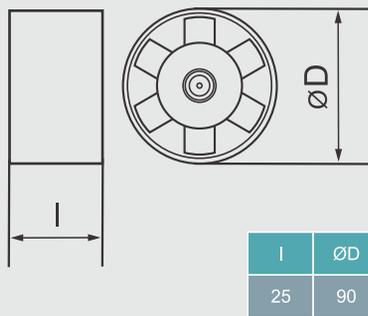

• Temperature Sensor

VOK series fans can be fitted with a thermostat to provide a controlled start / stop of the fan in heating installations. Where the airflow needs to be controlled, the fan could be operated by a speed regulator.

VENTILATION SOLUTIONS

Industrial Fans

PVO series

Designed for continuous or intermittent ventilation of medium to large sized living, administrative, commercial, industrial and agriculture premises.

<https://retail5.com.ua>

Trickle Impregnation Technology

- Sealed motor against dust and moisture
- High temperature resistant electric motor
- Maximum isolation characteristics
- Longevity of the electric motor

FAN CATEGORIES

THE PVO SERIES FANS FALL IN THE FOLLOWING CATEGORIES:

High Flow Rate - PVO154/2; PVO 200/2; PVO 250/2; PVO 300/2.

Low Noise - PVO154/4; PVO 200/4; PVO 250/4; PVO 300/4; PVO 350/4; PVO 400/4.

Noiseless - PVO 200/6; PVO 250/6; PVO 300/6; PVO 350/6.

TECHNICAL DESCRIPTION

Designed for continuous or intermittent ventilation of medium to large sized living, administrative, commercial, industrial and agriculture premises.

Operating in conditions of normal fire risk, according to fire-safety building and construction regulations.

They can be mounted on walls, ceilings, ceiling panels etc. The PVO series fans are constructed with noiseless asynchronous motors with double capsulated ball bearings, which guarantee 30 000 hours of flawless operation, whether mounted in horizontal or vertical position.

The measured level of noise is 70dB.

SAFETY

The protection degree is IP 54, and upon a customer's request can be manufactured to IP 55, which allows the fan to operate not only in closed premises, but in outdoor high humidity environments.

Energy-efficient

PVO UE - Energy-efficient low-noise fans.

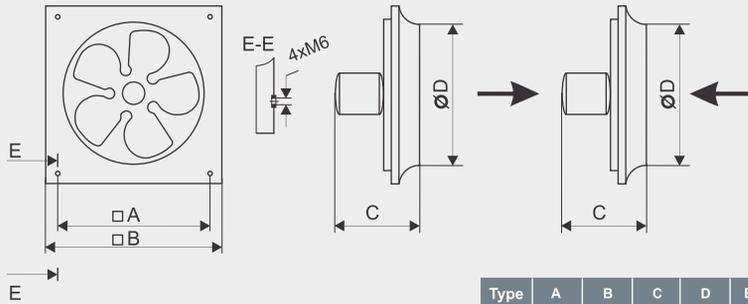

Series with double capsulated ball bearings NSK Japan which guarantee 30 000 hours of continuous operation.

The maximum flow rate value depends on the voltage and the angle attack of the impeller. The fans can be designed to operate on other voltages and frequencies if required.

The PVO series industrial fans can be supplied with an electronic fan regulator.

The two pole type fan can be modified from 900 min⁻¹ up to 2600 min⁻¹ RPM and 500 min⁻¹ up to 1400 min⁻¹ for four pole types.

This allows the user to gradually change the rotational speed of the fan and adjust the flow rate and noise level to the required level.
